Core vaccines recommended based on University of Florida vaccine protocol

FVRCP

River Ridge Animal Clinic uses the recommended vaccine protocol that has been issued by the University of Florida. Their recommendations for “core” vaccines (basic minimum vaccines for all kittens) include FVRCP. This vaccine protects against:

- **Feline Viral Rhinotracheitis** (aka feline herpes), a highly contagious respiratory disease characterized by sneezing, loss of appetite, fever, and eye inflammation.
- **Calicivirus**, another serious feline respiratory infection with which cats may show signs of ulcers on the tongue.
- **Panleukopenia** (aka feline distemper): a contagious disease whose symptoms include fever, loss of appetite, vomiting, and diarrhea.

This vaccine must be boosted 3 weeks after the initial injection in cats that have never received this vaccine before. The cost for this vaccine is \$20 .00.

Yes, I want my cat vaccinated with the FVRCP vaccine_____

No, I decline vaccination for my cat_____

Rabies Vaccine

Rabies vaccination is required by Florida state law and is not an optional vaccine. This vaccination is administered between 14 and 16 weeks of age. The cost for this vaccine is \$20 .00.

Yes, I authorize a rabies vaccine to be administered_____

Optional vaccines recommended based on risk factors

Feline Leukemia Vaccine

Feline leukemia virus is the leading viral killer of cats. The virus is spread through the saliva and nasal secretions of infected cats. Infection is transmitted through prolonged contact with infected cats, bite wounds, and from an infected mother cat to her kittens. Cornell University estimates that fewer than 20% of infected cats will survive more than 3 years after being infected. The veterinarians at River Ridge animal clinic recommend that BE tested prior to vaccination. This vaccine must be boosted 3 weeks after the initial injection. The cost for this vaccine is \$24.00.

Yes, I want my cat to be vaccinated against feline leukemia_____

No, I decline leukemia vaccine for my cat_____

Optional Testing

Feline Leukemia/FIV (feline immunodeficiency virus) Test

All new kittens and cats being brought into a household should be tested for feline leukemia and FIV. The veterinarians at River Ridge animal clinic recommend testing annually for cats at risk for these diseases. The cost of this test is \$40.00.

Yes, I want my cat to be tested for feline leukemia and FIV_____

No, I decline testing for my cat_____

Fecal Parasite Analysis

According to the US government's center for disease control, some dog and cat parasites can be transmitted to humans, especially small children and immunosuppressed family members. These parasites can potentially cause serious health problems such as skin rashes, intestinal disease, blindness, seizures, encephalitis, and meningitis. We recommend a fecal parasite test (microscopic examination of the feces) be performed annually for adult dogs. Many of these parasites cannot be seen by the naked eye. The cost for this test is \$26.00.

Yes, I want a fecal parasite test performed _____

No, I decline a fecal parasite test for my cat _____

I, the undersigned owner of the pet identified below, declined fecal parasite test and/or treatment for my pet as recommended by River Ridge Animal Clinic. I understand that this fecal parasite test and treatment for intestinal parasites is aimed primarily at improving or maintaining the health of my pet. I have been informed that eliminating intestinal parasites from my pet is also important for the health of my family and the community. In the event that any individual, including myself, contracts or develops a medical problem caused by intestinal parasites that could have been diagnosed and treated in my pet by conducting a fecal parasite tests and/or prevented by administering the recommended parasiticide to my pet, I agree to hold the staff at this practice harmless for any of the fees related to the diagnosis or treatment of such symptoms, or for any temporary or permanent injuries related to such a parasite infection that might have been prevented had such a test or treatment been performed. Wellness Bloodwork

Similar to the bloodwork your physician performs on you, bloodwork done on your cat may indicate an underlying medical condition or the results can be used as a baseline for comparison in the future. Many diseases are treatable when discovered in the early stages. A wellness profile includes a biochemical analysis which measures the following:

| | |
|------------------------|--|
| ALT,ALP | These are liver enzymes. They help indicate a problem with the liver. They may also be abnormal with inflammation of the pancreas. |
| Total Bilirubin | Test for jaundice. Increased levels may indicate liver disorder or damaged red blood cells. |
| Total Protein, Albumin | Protein levels associated with disorders of the intestine, kidney, and liver. |
| Creatinine, BUN | Indicators of kidney function, which should be run in conjunction with a urinalysis to accurately assess kidney function |
| Glucose | Blood sugar. Increased levels may indicate diabetes. |

Also included in the wellness profile bloodwork is a total T4 (thyroid test). The cost for this bloodwork is \$79.00.

Yes, I want a wellness profile performed on my cat _____

No, I decline a wellness profile____**By signing below you acknowledge we have discussed the topics within this review and you agree with the assessment.**
